

Abstract for CN2390207Y

This utility model relates to apply the microfluid biological chip to the microfluid biological analysis plate of chemistry or bioanalysis and the detection method thereof, the microfluid biological analysis plate comprises chip board and cover board, the little slot passageway is provided on the chip board, and the passageway couples response points, transparent cover board makes the chip board sealed, or response points are provided on the chip board, and the little slots are provided on the cover board. The detection method can fix different kind of probes or marker molecules into the response points of the microfluid biological analysis plate, and analysis the components of the same sample on the same chip simultaneously.
